OVENS

Stop position

Interior light

Upper resistance: food receives heat from above. It can be used to heat up pre-cooked food, or to unfreeze bread, pizzas or pasta in general.

Lower resistance

Traditional cooking: Upper resistance + Lower resistance. Ideal for roast meat or fish, biscuits, baked apples etc. Food becomes crispy on the outside, and juicy inside.

Grill Standard: The 850w grill provides a soft central heat to brown or cook dishes au gratin of small dimensions, or grill thinly sliced vegetables or meat.

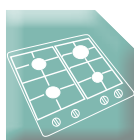

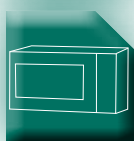

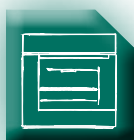

Ventilated Total Grill: Total grill + Ventilator. It substitutes the revolving spit and guarantees excellent results with poultry, sausages and red meat; with the heat, thanks to the ventilator, it makes it unnecessary to turn the food over.

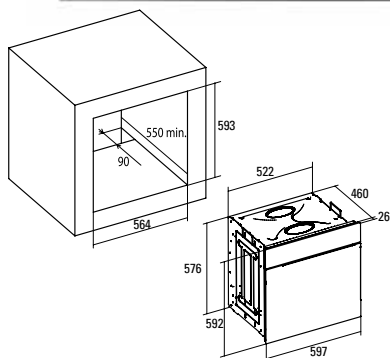

Ventilated Traditional Cooking: Upper resistance + Base resistance + Ventilator. Special Confectionery. Food receives heat from below and from above but this is shared out homogeneously propelled by the ventilator. Different types of food can be cooked at different levels without the smells or tastes being mixed.
